

info **Holstein**

May/June 2017 issue no. 145

*A Holstein Canada publication providing
informative, challenging and topical news.*

Thank you for Experiencing the City Lights with York Region!

Hosted by York Region Holstein Club, York Region, Ontario

On behalf of the 2017 National Holstein Committee, we would like to thank you for your generous support. The convention was a huge success and was enjoyed by dairy enthusiasts from across our great country. It was your support that enabled us to put together such an outstanding week full of fantastic events that catered to all. The dairy industry continues to be strong and carries the maple leaf proudly on the global front thanks to people and industry partners making it what it is today, as well as supporting the youth of tomorrow. ~The 2017 National Holstein Committee

Q & A

Meet the New President: Orville Schmidt

Rollyview, Alberta

Prefix: Southrise – Master Breeder in 1995

Family: My wife Lorraine and I have been married for 40 years this year. We have two sons, Jason and Marc. Marc is married to Lana and they have two little girls, our granddaughters, Keira and Emma.

Tell us a little about your farm: Our farm is a third generation farm, and began producing milk in 1946. Over the years we milked up to 150 cows in a parlour/free-stall and tie-stall barn. We sold our quota in 2010, but continue to raise, breed and calve heifers. We currently have about 125 head and calve between 50 and 60 per year. We flush and show cattle frequently, and we focus our breeding on red & whites and polled genetics. Some of the cow families we have enjoyed working with are those of Apple, Roxy, Splendor and Suzette. We also farm 800 acres of land with my brother, Bruce, where we grow wheat, canola and hay.

What made you want to become a Holstein Canada member? In my early teens, I went to a local Holstein show, joined 4-H, and from there became “hooked” on the Holstein cow and her genetics. My uncle became a Holstein Canada member in 1942, my father in 1955, and I became a member in 1974. I wanted to learn about Holstein Canada programs in order to improve our herd, and we started on ROP and classification in the late 1960s.

What motivated you to become a Holstein Canada Director? I have always believed in being involved. Over the years, I have been active with the Northern Alberta Holstein Club including a term as President. From there I became involved at the Provincial Board level and served as President of the Alberta Holstein Branch Board of Directors in 2001 and 2002.

At the national level, I served on the “Futures Committee” and the GEB. During this time I became interested in the future of the industry and its changes, and wanted to be part of changing the dairy industry. I really wanted to offer some of my experience and passion for the breed.

What is your vision for Holstein Canada? My vision is for Holstein Canada to continue to promote and improve the classification program, while also developing programs to maximize genomics. I would like Holstein Canada to become the central organization to provide all genetic and breed information to our membership and the Holstein enthusiasts around the world.

What is the one thing you are looking forward to the most during your year as President?

I am looking forward to the opportunity to leave a positive impression on all of the Holstein Canada member producers and Holstein breeders across the country, and to be able to visit with them on their home turf.

What do you feel is the most valuable Holstein Canada service? I feel strongly that classification and parentage verification are equally valuable.

What advice would you offer to a young Holstein enthusiast that wants to get involved with a Holstein board, whether nationally, provincially or locally? I would encourage them to get involved; be prepared to bring their vision; listen to their associates; be positive, even in tough situations; and above all, enjoy the experience! 🇨🇦

Canadian Dairy History in the Making

Dairy farmers have been a part of Canada's history for over 150 years, and the passion that drives Canadian dairy farmers ensures that they will be an integral part of Canada for the next 150 years. By feeding the country in a sustainable way, dairy farmers have withstood the test of time, from before Confederation to the present day.

In celebration of Canada's 150th anniversary, Dairy Farmers of Canada has produced a book, *Dairy Farmers—Deeply Rooted for a Strong Future* that honours Canada's dairy tradition and the contributions dairy farmers have made to Canada's emergence as a nation.

This booklet traces the emergence of dairy farming in each of Canada's provinces in the order in which they joined Confederation. By featuring a different dairy farm from every province we have captured the unity of a sector that has fed our country in the past and that is committed to doing so for the future.

Dairy Farmers of Canada invites you to learn more about the development of the dairy industry province-by-province, and introduces you to 10 farming families whose ancestors contributed to the creation of this country, and whose current generation is still feeding Canadians today.

The farms presented in the book were chosen based on each family's availability and interest in the project. DFC is grateful to each of them for their generosity and the time they dedicated throughout the book's production. A PDF version is available on Dairy Farmers of Canada website <https://www.dairyfarmers.ca/news-centre/document-library/dfc-policy-conference>.

FOREWORD

Dairy Farmers of Canada is proud to showcase the contributions of Canadian dairy farmers in the building and growth of our country as we celebrate the 150th anniversary of Canada.

Dairy farmers have been a part of our nation's rich history for over 150 years, and as you read through these pages you will find the passion that drives Canadian dairy farmers to ensure that they will be an integral part of Canada for the next 150 years. By feeding the country in a sustainable way, dairy farmers have withstood the test of time, from over before Confederation, to produce Canadian quality milk.

Canada is one and dairy farmers across the country are so different and unique in the regions in which they reside. While different regions of the country may shape the way in which each dairy farmer produces milk, there are also many ways in which every dairy farmer, regardless of where they live and how, are united. They share numerous values and face many of the same challenges. The values that drive us are rooted through the backbone of each of these diverse, great farms.

As an organization and its members, a sense of pride in feeding Canadians, and a strong commitment to sustainability.

By featuring a different dairy farm from every province we have captured the unity of a sector that has fed our country in the past and that is committed to doing so for the future.

Dairy Farmers of Canada is honoured to share these stories with Canadians.

Wally Smith
President
Dairy Farmers of Canada

SUSTAINING A NATION

Centuries before the founding of Canada, two passengers who would profoundly shape the emerging nation arrived in a small port that would become Quebec City. The ship *Don de Dieu* carried Samuel de Champlain credited today as the founder of Quebec. Also aboard the vessel, known in English as Gift of God, was a largely unheralded trailblazer—the first domestic dairy cow to arrive in New France. Her descendants survive to this day and the aptly named *Canadienne* is Canada's only native breed.

Canada's earliest dairy farmers left behind all they had and braved to pursue a new life in a new and often harsh new world. In hard cases, the decision to emigrate meant they would never again see their families or be cared for in their own country.

Some had left farms in their countries of origin, others had been lured before they purchased land and livestock in the New World. However, the lands beyond stretched were common to all. These small homesteads supported their families and laid the foundation throughout the world we see, the Spanish Missions, and the Great Depression.

A turning point that marked the arrival of Canadian dairy farms was the introduction in the early 1970s of the supply management system, which matches dairy supply with consumer demand and provides farmers with a stable income. After years of economic hardship, the needs-based stability has allowed farmers to invest in sustainable health, safety, sustainable practices and quality improvement for future generations.

Today, there are 17,300 dairy farms located in each province across the country. Dairy farms were never established in Canada's territories due to public transportation.

Some of Canada's dairy farms in operation today were founded long before Confederation. From heritage farms along with their family traditions and knowledge of the land, they have passed down through generations of ownership to over 150 years. Dairy farming is also deeply intertwined, one might say particularly, with the lives of our heritage farms and their role in Canada's history for the next 150 years.

To commemorate a Canadian milestone, Dairy Farmers of Canada has produced this booklet to honour the men and women who have sustained our nation from its earliest days to the present. This booklet traces the emergence of dairy farming in each of Canada's provinces in the order in which they joined Confederation. The 100 provinces that formed Canada in 1867 were New Brunswick, Nova Scotia, Ontario and Quebec. The present-day 10 provinces (through time, we believe) that have been joined to us are: Canadian quality milk day after day.

A Canadian Cow

The *Canadienne* is the only breed of dairy cow native to North America. It is a result of crossbreeding cows and generally has a black coat with a pale face, red eyes and horns. She is hardy, alert and gentle. The *Canadienne* gained a reputation for its reliability and resilience in the harsh climate of the New World.

The *Canadienne* represented the majority of dairy cows in Quebec until 1840, when newly imported breeds were introduced in 1840, when faced with the threat of extinction, breeders created the *Canadienne* cattle breed's base book.

Today, there are only about 200 females with pedigree status in most Canadian provinces mixed with the *Norman* breed. However, a recent trend toward the traditional *Canadienne* has spurred recovery of the genetic makeup. This is crucial to guarantee the future of this breed which is a part of French-Canadian heritage.

Today, dairy cow breeds on farms include the *Norman*, *Jersey*, *Ayrshire*, *Brown Swiss* and *Canadienne*.

Conformation Assessment Updates

HOLSTEIN CANADA is proud to be governed by members for members. As such, our Classification Advisory Committee, made up of members, classifiers, AI representation and a veterinarian, meets annually to discuss the current status of our conformation assessment program and potential updates and/or changes.

As our industry continues to change and our understanding of conformation evolves – both affecting economic parameters on our dairy farms – our conformation program continues to change to reflect this evolution as well. As a result, our Board of Directors has recently approved the following updates to the conformation assessment program. These updates were put forward by the Classification Advisory Committee as a result of the valuable feedback and input received from the Classification team in the field.

The following updates will take effect June 12, 2017, allowing the classification team time for training at the semi-annual Classifier Conference in June.

In an effort to be more transparent, **online animal profiles** will now display any **defective characteristics** that have been assessed at the time of classification.

Under the **Dairy Strength** section, a new defect titled **"Undesirable Head"** will be added and will replace the current defective characteristics: **Wry Face and Malformed Jaw**. Wry Face and Malformed Jaw are used so infrequently they do not warrant their own specific defects, but rather one combined defect. Undesirable Head will also include: Narrow Jaw, Short Head, Narrow Muzzle, Roman Nose and Buggy Eyes. One point will be deducted for a single tick for Undesirable Head. While a two point deduction for a double tick indicates a Severely Undesirable Head.

Under the **Rump** section, **Wry Tail** will also be removed from the defective characteristics as this defect is rarely observed and essentially has no impact on the Holstein Breed.

Under the **Mammary System**, we will be adding a new trait called **"Udder Floor"**. Udder Floor will have a trait weight of four percent, with the ideal linear code of 5-6 for first lactation animals. In second lactation animals or higher, the ideal linear code will be 5. By adding this new trait, the trait weight for **Udder Depth** will decrease from 16% to 12%.

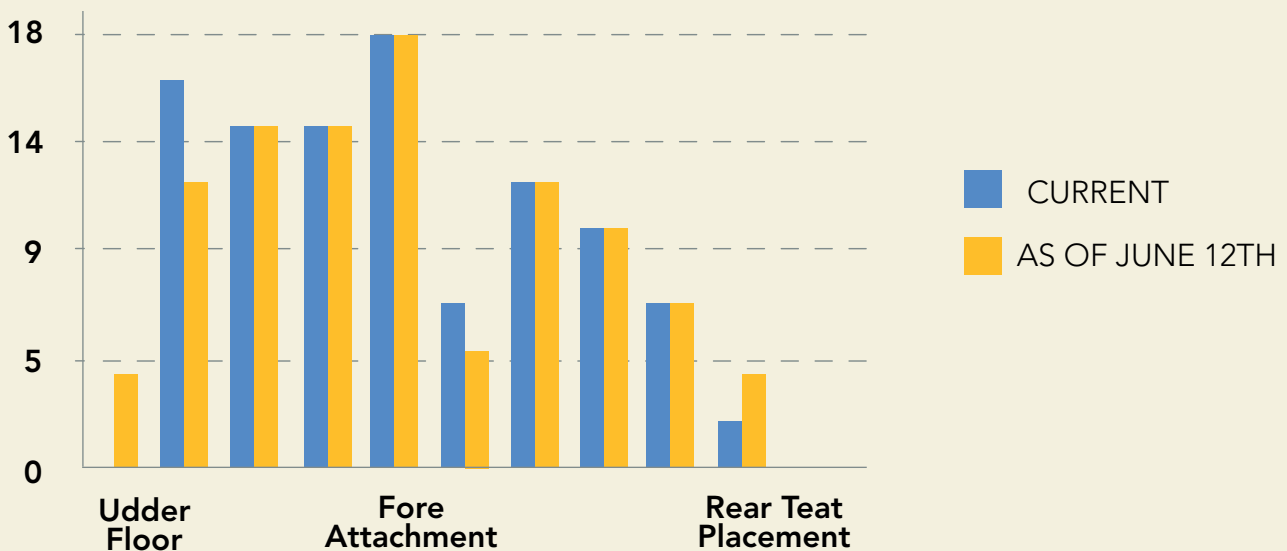

UDDER FLOOR

As a result of adding Udder Floor, defective characteristics **Tilt** and **Reverse Tilt** are no longer necessary and therefore will be removed from the scorecard.

Also under Mammary System, two percent trait weight will be removed from Front Teat Placement (7% down to 5%) and will be added to **Teat Length** (from 2% to 4%) as classifiers have noted short teat length may become a conformation concern.

Mammary System (42%)

Pro\$

Genetic Selection for Profit

Developed and launched almost two years ago, Pro\$ is a selection tool that maximizes genetic response for daughter lifetime profitability. Many producers have familiarized themselves with the Pro\$ index, and have been successful in implementing it as a tool in their genetic toolbox. In this edition of InfoHolstein, we decided to take a closer look at what Pro\$ is, tackle some frequently asked questions about the new index and connect with a few producers that are using Pro\$ in their breeding program.

Pro\$ is a selection tool that maximizes genetic response for daughter lifetime profitability.

Pro\$ is based on sound science and takes current economic values into account for the calculation of expenses, income and overall daughter profitability.

The information used to calculate the traits that make up Pro\$ comes directly from Canadian dairy farms, the backbone being DHI cow profitability data.

Pro\$ was developed using regression analysis - a method that considers genetic relationships among traits to determine the contribution that sire evaluations for each trait have in terms of predicting the average lifetime profit of their daughters in an objective way.

Average Expected Performance Increase after 3 Generations of Selection in the Herd (HO)

Compared to LPI, using Pro\$ as a primary selection tool will maximize production and functional traits. If the main goal of an operation is milk sales, using Pro\$ as a primary selection index will lead to a highly profitable herd.

INTERPRETATION OF PRO\$...

Daughters of a bull with a Pro\$ of 1000 can be expected to generate \$1000 more profit to six years of age than daughters of bull with a Pro\$ = 0 (an average bull).

Selection for Pro\$ will lead to a herd of cows that excels for production, is long-lasting and has a level of functional conformation that supports these two characteristics.

Is Pro\$ just a Canadian version of the US Net Merit (NM\$)?

Pro\$ is not a Canadian version of the US Net Merit. Differences between Pro\$ and NM\$ are numerous, but key ones include:

- Pro\$ uses Canadian economic values (income & expenses) for the calculation of cow profitability
- Pro\$ is expressed in Canadian dollars, NM\$ is expressed in US dollars
- Pro\$ takes Canada's supply management system into account
- Pro\$ was developed by using regression analysis which considers genetic relationships among traits to determine the contribution that sire evaluations for each trait have in terms of predicting average daughter profit in an objective way. NM\$, on the other hand, places relative weights on traits based on economic importance in the US
- Pro\$ includes various traits that are not evaluated in the US, which provides producers the opportunity to make genetic improvement for Mastitis Resistance, Body Condition Score, Milking Speed and Milking Temperament along with the other important functional traits like Herd Life and Daughter Fertility.

Both Pro\$ and LPI are calculated and equally supported by CDN. In the US, NM\$ is calculated by Council on Dairy Cattle Breeding (CDCB) and TPI is calculated by Holstein USA. Since the two US indexes are calculated and supported by different organizations with varying goals, the indexes can be considered as competing.

Is Pro\$ only meant for large herds?

No, definitely not! Pro\$ will be a useful tool for any producer who generates essentially all of their farm revenue from milk sales, despite the herd size.

What can I expect if I use one index versus the other?

Compared to LPI, using Pro\$ as your primary selection tool will maximize production yields and the other functional traits (Graph 1). On the other hand, using LPI as your primary selection tool will lead to a herd with exceptional conformation, fat and protein deviations without sacrificing Daughter Fertility or Mastitis Resistance. No matter which index you align yourself with, you can be confident that all of the information that feeds the traits in each index is sourced directly from Canadian dairy farms.

Table 1 (see table, right) examines two herds of a similar genetic merit. Herd A decides to select sires exclusively for Pro\$ while Herd B chooses to select bulls exclusively based on LPI. After three

generations of selection for Pro\$, you can expect the daughters resulting from selection in Herd A to produce 256 kg (i.e.: 1744-1488) more than resulting daughters in Herd B. However, you can expect 4% more of the cows in Herd B to be scored Good Plus or better than the cows in Herd A.

It is important to note that the results seen in the Graph 1 are only achieved when selection occurs exclusively for each of the indexes. If, for instance, an index like LPI is used as a primary selection tool and then a secondary filter, such as >10 for Conformation is applied, the selection response trend will be altered for all traits.

Since Pro\$ has less of a response for type traits in Holsteins, does this mean type isn't related to profit?

No. A certain level of functional type is essential to lifetime profitability. Functional type leads to healthier, more trouble-free, longer-lasting cows. Selection for Pro\$ results in a balance of functional type for longevity, health and production traits that optimizes profitability.

Conversely, it can be argued that in certain markets, type is more related to profit (for example, a market for genetic sales of high type individuals). In such unique situations, type is more profitable than is reflected in Pro\$.

Trait	LPI	Pro\$
Production		
Milk (kg)	1488	1744
Fat	74	75
Protein	56	60
Fat Deviation (%)	0.22	0.13
Protein Deviation	0.07	0.03
Functional		
Mastitis Resistance		
- % Healthy in 1st Lactation	1.3%	1.2%
- % Healthy in Later Lactations	2.5%	2.4%
Herd Life		
- Productive Life (months)	4.7	4.8
- % Survival to 4th Calving	13.0%	13.3%
Calving Ability		
- % Unassisted or Easy Births from Heifers	2.8%	3.2%
- % Calves Born Alive from Heifers	1.7%	2.0%
Daughter Calving Ability		
- % Unassisted or Easy Calvings at Daughter's 1st Calving	2.8%	2.9%
- % Calves Born Alive at Daughter's 1st Calving	2.5%	2.7%
Daughter Fertility		
- Days Open	-2.08	-1.73
- % Pregnancy Rate	1.4%	1.2%
Conformation		
- % Good Plus or Better	26%	22%
- Average Final Score (points)	2.35	1.94

We have decided to use the Pro\$ index instead of the LPI index as a way to rank the bulls because we believe it to be more of an economics based index. We try to make the most of our farming and business decisions based on economics. Sire selection is very important to the future of the herd. Using Pro\$ for that makes business sense.

— Anton Borst, 800 cows, Halarda Farms Ltd., Elm Creek, Manitoba

To learn more about Pro\$ and how it can work for you, visit www.cdn.ca or speak to your AI representative.

Ferme Miralys Inc.

Explain the genetic strategy in your herd and where Pro\$ comes into play:

Although breeding is still relatively new to me, Pro\$ allows me to select the animals that will maximize the revenue of my operation. This includes raising productive animals that are 22 months old at first calving so the animals are profitable as quickly as possible. Without neglecting conformation, I put a lot of emphasis on fat and protein yields, as well as health & fertility.

What made you decide to adopt Pro\$ as part of your breeding strategy?

I target slightly more production because it has a direct influence on the profitability of the operation. As my income is based on yields, I'm more comfortable using an index that is more suited to my needs.

What tools do you use to help carry out your herd's genetic strategy? And how are you using those tools?

I currently use genomic testing to be able to confirm my choices quicker, but I remain cautious and I like to see the results with my own eyes, once the cows are milking. For this reason, I do not flush heifers that much, but perhaps someday! A tool I use a lot on the Holstein Canada website is Animal Inquiry as it allows me to validate a lot of information like Pro\$ in the pedigrees of the animals, this includes sisters and their offspring. I also pay much attention to the breeding choices made by other recognized breeders.

How has your genetic strategy changed since adopting Pro\$ as a genetic tool?

I started shipping milk in December 2013; therefore, my genetic strategy does not have a long track record, but let's say I now have a selection index that meets my goals with regards to the selection of females and sires.

Did you find there was a learning curve to using Pro\$?

Not really. The more important thing is to take the time to understand how Pro\$ compares to LPI. If this is more of interest to you, Pro\$ is an additional tool to help you make decisions.

What has been the biggest benefit to using Pro\$? In contrast, what has been the biggest challenge?

It is too early to talk about benefits, because the first animals mated using Pro\$ are still calves. However, their genetic indexes show a lot of promise, but it all remains to be confirmed in the future. Initially, the biggest challenge was to select a better sire using Pro\$ than we thought it would be using LPI. It will also not be surprising to see the LPI level of my herd decrease in the long term.

Farm name: Ferme Miralys Inc.

Prefix: MIRALYS

Location: St-Bernard, Quebec

People involved: Régis Berthiaume, one part-time employee, and occasionally his spouse, Dominique Bouchard, who is a veterinarian.

of Years as a Holstein Canada Member: Since December 2013

of Cows Milked: 32 cows for 46 kg of quota

of Acres Farmed: None, no machinery, 100% external supply

Facility Type: Tie-stall, 40 stalls for milking and dry cows; heifers raised in free-stall (custom raised)

What is your feeding system? Conventional, corn silage, round bales of forages and complete feed.

Are there other breeds in your herd? No

Holstein Canada Services used: Registration, classification and genotyping.

Would you say using Pro\$ has helped to improve the profitability of your herd?

The profitability of a herd is based on several factors; it is therefore difficult for me to answer this question and to make such a statement in so little time. However, within a few years, I'd like to know exactly how old my animals are on average when they reach profitability, in order to set a new goal to exceed.

What advice do you have for someone that is reluctant to adopt Pro\$? Start by having a good understanding of the criteria for the Pro\$ index; after that, it's a question of goals and breeding strategies.

Where do you see the future of dairy cattle breeding? With all the tools available today, my hope is for it to be easier to achieve one's breeding goals than it was 25 years ago, and over a shorter period of time. Genomics should bring a good selection of animals to work with and the Pro\$ index should allow milk production in Canada to increase, while allowing operations to maximize the profitability of their animals. I'm also very interested in feed efficiency. For a farm

like mine, without any land and with 100% external supply, producing more with less becomes an important consideration as it relates to the profitability of my business.

And, finally, what does the ideal cow look like on your farm? First, it is a cow that transmits her qualities to her daughters, that improves my breeding criteria by more than 50% to ensure the animals from the next generation are superior. Specifically, I'm looking for a VG cow at her third calving which produces 2.4 kg of fat per day at her lactation peak and continues to produce over 1.5 kg of fat per day between calvings.

Waddy & Colpitts Ltd.

Explain the genetic strategy in your herd and where Pro\$ comes into play:

Pro\$ comes into play in our herd right from the beginning. We ONLY buy semen from high Pro\$ bulls. When selecting bulls, we look at the top 100 bulls available on the CDN Pro\$ list. The number of milking daughters is not criteria for us. We put extra weight on Daughter Fertility and Herd Life, kilograms of fat, and the new trait, Metabolic Disease. We focus on these areas because the major reasons cows leave our herd are fertility, death, or sold for breeding stock. Our buyers want high-production cows with good udders and feet & legs.

From the list of Pro\$ bulls, we pick 10 to 15 bulls, and select potential mates for each animal to be bred within the next two months. For each animal, we list two to four traits to improve, looking at both EBV and phenotype. Usually three or four bulls fit, and we choose the bull with the lower inbreeding percentage. Each time a cow freshens, we review the list of traits to improve. If a cow has breeding problems, mastitis etc., we pick a mate with +2 standard deviations for that trait.

Today, our herd has many daughters of *Oman* and *Manifold*. These need to be mated to bulls with sound type. We also include Pro\$ in our pricing strategy. A group of heifers at 1500 Pro\$ are priced \$500 higher than a group at 1000 Pro\$.

What made you decide to adopt Pro\$ as part of your breeding strategy? It is the best economic index. It is superior because it uses a statistical regression analysis instead of a committee decided trait formula.

What tools do you use to help carry out your herd's genetic strategy? And how are you using those tools? We use Genomic testing; all animals are tested through Holstein Canada using the

Farm name: Waddy & Colpitts Ltd

Prefix: Little River

Master Breeder 2003

Location: Colpitts Settlement, N.B.

People involved: David, Patricia & Fred Waddy, along with four full-time, year-round employees.

of Years as a Holstein

Canada Member: Since 1930

of Cows Milked: 165 cows

of Acres Farmed: 700

What is your feeding system? TMR: corn silage, alfalfa, high-moisture corn.

Are there other breeds in your herd? No, the Ayrshires were sold in 1960

Holstein Canada Services used: All of them: registration, classification, genotyping & NLID.

TSU system when we tag our calves. When the results come back, we look at the bottom 20% and cull accordingly. This also improves the accuracy of the EBV. We also use the CDN website for EBV and inbreeding calculator. We track all known haplotypes and recessive traits. If there is over 1% probability, we do not use that sire/dam combination. During a new proof round, when we gain new information on a sire in the tank and he drops in Pro\$, we no longer use the semen. We always want to use the best genetics available.

How has your genetic strategy changed since adopting Pro\$ as a genetic tool?

Our genetic strategy has changed very little. Many years ago, Fred had the privilege to serve on the Holstein Research Committee. He learned that the most important part of a breeding strategy is to always use the best bulls based on an economic index. The alternative, setting cut off levels for traits, will result in selecting second rate bulls. We have changed from using four or five proven bulls for three or four years, to using 20 or 30 different bulls per year. The days of having 50 *Goldwyn* and *Oman* daughters are past. Today a bull has a four-month window of use or less.

Did you find there was a learning curve to using Pro\$? No, for us it was very easily adapted.

Would you say using Pro\$ has helped to improve the profitability of your herd? Our production per cow, in kilograms of butterfat per day, has dramatically increased. Today we are not satisfied with 1.3 to 1.4 kg of butterfat per day; we are targeting 1.5 to 1.6 kg. The most profitable way to fill quota increases is more kilograms of butterfat per cow; Pro\$ helps us achieve this.

What advice do you have for someone that is reluctant to adopt Pro\$? I would tell them to look at their milk statement, and then look at what they sold last year for breeding stock. Then, go back 20 years and look at the same figures. The world has changed. If you are ranking bulls by LPI and are reluctant to change, continue to choose by LPI, but also make sure they are high Pro\$; this is actually quite easy to do!

Where do you see the future of dairy cattle breeding? The future will be focused on health traits, feed efficiency and high forage diets. Good herds will average five lactations per cow.

And, finally, what does the ideal cow look like on your farm? We do not know what the ideal cow will look like; she will tell us. For us, the ideal cow is a four-event cow, (freshening/single breeding/pregnancy check/dry-off), year after year. 🇨🇦

Holstein Celebrates Canada's 150th

For the third installment of our 150th celebration items, in this edition of InfoHolstein we have looked up the 150th animals registered and classified; the 150th genomic sample received; the 150th herd visited; and 150th genomic result received in 2017! Interestingly, all of these 150th milestones were reached in the first five days of the year...and the office wasn't even open for two of those five days!

150TH ANIMAL REGISTRATION

MEET THE 2016 MASTER BREEDERS

In years past, this edition of InfoHolstein would have included a copy of the Master Breeder booklet that contained bios and stats on each of the winning herds. These bios were also used to recognize the winners during the Master Breeder gala at the National Holstein Convention. This year, instead of writing bios to be read, we visited each of the winning farms and created videos to be played during the gala. These videos are available for viewing on our Holstein Canada YouTube channel. In the meantime, check out some fast facts on each of the 2016 Master Breeder recipients and what the Master Breeder award means to them.

Larry Krantz

"What does the Master Breeder award mean to me? That's a tough, tough question. It's pretty cool, but I guess it means that you have done the best you could, gotten the most out of what you have, had a lot of luck and that the cows bred on!"

"For us the second Master Breeder shield is really important. We participate in a lot of shows and not all of the animals we show carry our Prefix. Receiving our second shield shows we are continuing to meet our breeding goals beyond the ring, and even if there are different cow families, our breeding and objectives are still the same."

"We are very happy and honoured to be receiving a third Master Breeder shield. It is an important recognition from Holstein Canada. It validates the teamwork we do each day. It also signifies that we and our cow families have endured over time – that we have adapted our breed improvement to demand and the market."

"When I was younger, my dream was to have a wife, a family and a farm. Once we had all of these things, we set a goal to achieve a Master Breeder title. Now we have that and we are very, very happy!" - Denis Pelletier

"The Master Breeder says a lot for what Don and Frank have done over the last 15 to 20 years, and their dedication to breeding for good quality cows and good production. From the first shield to the second, what worked was investing in good cow families so it didn't really matter what bull you bred them to – they still came out nice cows." – Luke & Jimmy

"Personally, this is the ultimate goal I had set for myself when taking the reins of the herd. Even before that, all members of the Geno farm over the years had worked to improve cow comfort, animal nutrition and genetics for the sole purpose of one day earning a Master Breeder title." – Steve Naud

Simplified Online Genomic Result Pages

Image 1

In the January/ February 2017 issue of the Info Holstein, we featured an article called New Look for Online Accounts and Genomic Reports. Since that article was published, we have made some modifications to simplify filtering options on the genomic results pages (Image 1). Under each column heading, producers can now easily filter to find specific animals, or sort and rank results. Previously the filter options were more complicated than originally intended. As a result of your feedback, we have made modifications to make things easier.

One of the main features that still exists is the option to Display New Animals Only. If YES is selected, the grid will only display the most recent animal results (any result since the last official proof). If NO is selected, every animal tested will populate the grid.

To rank your results, you can simply click on the column heading filter icon and set your parameters. For example, if you only wanted to see animals with a GLPI greater than 2000 points, you would: [1] click on the filter icon, [2] select Is greater than, [3] type in 2000, and [4] click Filter. The grid would then only display animals that have a GLPI greater than 2000 points. This option is ideal if you would like to make management decisions on a group of animals.

If you are searching for a specific animal, the same process applies. For example, if you know the animal's name or part of their name, you would: [1] click on the filter icon of the Name column, [2] select Contains, [3] types in the animal's name or part of the name, and [4]

click Filter. The grid would then display animals with that name or similar spelling. The same process can be implied in the Registration # column if you are looking for an animal of a specific breed or sex.

The download options are still the same. To download an individual report, click on the download icon () that appears on the left of the desired animal. If you are looking to download the results of all animals shown in the grid, click on the "Download All as PDF" or "Download All as Excel" buttons depending on your preference. If filters have been applied to the grid, it will download based on those parameters. For example, if you set the filter to display animals based on birth year, when you click Download All as PDF, the PDF document will only include animals born in the year specified.

Should you have any questions about genomic testing, genomic results or how to filter, please contact our customer service department. 

Check out the "How To" video at youtube.com/HolsteinCanadaVideo

e-Documents Reminder

E-DOCUMENTS allow you to receive Holstein Canada official documents, such as Certificates of Registration, awards, invoices, statements, etc., through your web account. If you sign up for specific e-document preference, you will receive an email notification when that document becomes available in your web account, rather than waiting to receive it in the mail.

As a reminder, for those who have set their preferences to receive e-documents, you will receive an email notification. To access the actual document, please login to your web account through holstein.ca.

If you do not have a web account and/or want to learn more about e-Documents, please visit holstein.ca or contact customer service. 🇨🇦

#FrameTheHerd Photo Contest

Great photos are still rolling in for the #FrameTheHerd Photo contest! Thank you to everyone for your submissions!

Meet our Top 4 Finalists from Theme #9 - Canadian Winters!

Snow blowing at its best! –
Submitted by Michelle Visser,
Ravenna, Ont.

Nothing like a mini-blizzard when moving
heifers! – Submitted by Catherine Roy,
Ferme André Audet inc, Compton, Que.

Baby, it's cold outside! –
Submitted by Jamie Wilson, West
Port Holsteins, Port Perry, Ont.

Can we have a ride too? – Submitted
by Danyca Schneider, Dameya
Holsteins, Glen Robertson, Ont.

THEME #11: CANADIAN MILK

This theme is inspired by DFC's recent #TallColdOne campaign! We want to see you enjoying a big refreshing glass of Canadian milk! Whether it is straight up, chocolate, strawberry, or any other flavour, we want to see you enjoying it in a setting that also showcases your farm and/or cows! Be creative...but not TOO cheesy! (Get it?) As always, bonus points if you can sneak a Holstein Canada logo into the photos somehow (hats, jackets, etc.), and we also don't discriminate against colour, so send us those all-breed photos as well!

THE DETAILS:

- Photos should be high-res digital images (300 dpi is preferred)
- There is no limit to the number of entries person
- Any visible animals MUST be properly tagged to be considered

Entries are to be emailed to socialmedia@holstein.ca and should include the names of any people and animals, as well as the prefix when possible. *If you do not have access to email, but wish to participate, call Jennifer at 1-855-756-8300 ext. 234 to make alternate arrangements.

DEADLINE
JUNE 30, 2017

ON SOCIAL MEDIA? SHARE YOUR ENTRY WITH THE WORLD! EMAIL YOUR ENTRY TO US AND SHARE IT ON SOCIAL MEDIA USING #FRAMETHEHERD AND #TALLCOLDONE
